Logan Ross

SENIOR FRONTEND DEVELOPER

Profile

After my van broke down for the fourth time in a row, I realized that being in a band just wasn't paying the bills. That day I decided to teach myself programming. I quickly found that I had a natural ability to learn at a high level, a real knack for software, and an immense passion for computing.

At this stage in my career, I'm able to beautifully and expertly architect user interfaces at the highest level. I can design, develop and ship at the product level. I've worked in web2 and pushed the boundaries of web3, led teams, and designed products from their inception.

I'm attracted to projects that move the needle forward, help people in some way, and are just plain cool ideas.

Employment History

Senior Frontend Developer (Contract), Ellipsis Labs, New York, NY

JANUARY 2023 — MARCH 2023

Ellipsis Labs is the team behind Phoenix, a decentralized limit order book built on Solana that's fully on-chain, non-custodial and crank-less.

I designed and developed the entirety of their user-facing product from the ground up as a solo engineer. This included a highly polished Swaps interface, a striking Data interface, and a lightweight TypeScript SDK for interacting with their on-chain programs.

Senior Frontend Developer (Contract), Slide, New York, NY

SEPTEMBER 2022 — JANUARY 2023

Slide is a UX-focused custodial wallet and NFT payment rail for non-native crypto users.

I restructured and rebuilt their TypeScript and React client SDK's while designing many core product features for their Polygon wallet. The feature I'm most proud of working on is their credit card based NFT checkout. For this, I played an important role in resolving some of the many UX frustrations associated with web3 payments.

Senior Frontend Developer , Jet Protocol, Remote

MARCH 2021 — SEPTEMBER 2022

Jet is a decentralized lending and borrowing protocol built on Solana.

As the first employee, I created the entirety of the V1 lending protocol's user interface and TypeScript SDK. Before leaving Jet, I also designed important features such as margin trading through Serum, what I called "leveraged" swaps through Orca, and a custom component library which reduced development time greatly for newly on-boarded developers.

Full-Stack Developer, Dealr, Longmont, CO

JUNE 2019 — MARCH 2021

Dealr is a cloud-based software that allows you to run your car dealership's website, inventory management, lead follow-up, and deal closings all in one system.

I created a composable and easy-to-use website CMS that integrated with Dealr's cloud-based dealership management platform. During my time here I was also responsible for the specification and implementation of widely requested features from customers, bug fixes, and overall code maintenance/refactoring.

Hobbies

If I'm not coding then I'm either annoying my neighbors by playing guitar, getting really into video games with my wife, trying my best to land a kickflip, or doing Jiu-Jitsu.
